

Abstract: Governance consists of the traditions and institutions practiced by governments within any nation. This includes the ability to adequately identify and implement successful policies and procedures by the authority, the manner of choosing, monitoring, and changing the government; and respect of citizens and the state for the institutions that govern economic and community interaction among them. The aim of this study is exploring the impact of governance on economic growth, with considering the spatial component using spatial regression techniques, where the spatial regression deals with the specification, estimation, and diagnostics checking of regression models that incorporate spatial effects. The study also utilizes five control variables in order to help to measure the relationship between Governance and Gross Domestic Product.
